Slide 2 of 12

30+ Years

1981 — the Ericsson CS Lab has been founded.

1981-1986

- a lot of work to decide which paradigm would be better to use in the telecommunication domain;
- conclusions: doesn't exist the perfect paradigm but several characteristics should be mixed.

1987 Erlang is born

- the name is after the Danish mathematician Agner Krarup Erlang but could also mean **E**ricsson **l**anguage.

1987-1991

- the JAM ("Joe's Abstract Machine") virtual machine (inspired by the Prolog WAM) has been implemented (in C);
- in 1998 it has been replaced by BEAM ("Bogdan/Björn's Erlang Abstract Machine").

1996 — **O**pen **T**elecom **P**latform (**O**TP) has been released.

1998

- Ericsson stops to develop Erlang but not to use it
- Erlang becomes open source
 - since 2006 the BEAM supports multi-core processors.

Erlang is concurrency oriented, i.e., the process is the basic of every computation.

Erlang adopts the actor's model for concurrency with

- asynchronous message exchange;
- non shared memory

Erlang is a dynamically typed functional language.

Erlang supports distribution, fault tolerance and hot-swapping (dynamic SW updating).

Slide 4 of 12

```
-module(fact).  
-export([fact/1]).  
  
fact(0) -> 1;  
fact(N) -> N*fact(N-1).
```

The program must be run through the BEAM shell

```
[12:56]cazzola@mangog: ~/lp/erlang-erl
Erlang/OTP 24 [erts-12.3.2.6] [source] [64-bit] [smp:16:16] [async-threads:1] [jit]

Eshell V12.3.2.6 (abort with ^G)
1> c(fact).
{ok,fact}
2> fact:fact(7).
5040
3> fact:fact(100).
9332621544394415268169923885626670049071596826438162146859296389521759999322991560894146
39761565182862536979208272237582511852109168640000000000000000000000
```

Alternatively it could be run as a script via escript or through native compilation via HiPE.

References

```
1> 10.  
10  
2> 16#FF.  
255  
3> $A.  
65  
4> -12.35e-2.  
-0.1235
```

- `b#val` is used to store the number “val” in base “b”;
- `$char` is used for ascii values.

```
1> cazzola@di.unimi.it.  
'cazzola@di.unimi.it'  
2> 'Walter Cazzola'.  
'Walter Cazzola'  
3> 'Walter^M  
'Walter^M'  
4> Cazzola'.  
'Cazzola'  
5> 'Walter\nCazzola'
```

- atoms start with lowercase letter but can contain any character;
- if quoted they can start by uppercase letters.

Sequential Erlang Overview

Tuples and Lists

```
1> {123, "walter", cazzola}.
{123, "walter", cazzola}
2> {}.
{}
3> {abc, {'Walter', 'Cazzola'}, 3.14}.
{abc, {'Walter', 'Cazzola'}, 3.14}
4> {{1, 2}, 3}=={1, {2, 3}}.
false
```

- used to store a fixed number of items;
- tuples of any size, type and complexity are allowed.

```
1> [].
[]
2> [1|[]].
[1]
3> [1|[2]].
[1, 2]
4> [{1,2}, ok, []].
[{1, 2}, ok, []]
5> length([{{1, 2}, ok, []}]).
3
6> [{1, 2}, ok, []] == [{1, 2}, ok, []].
true
7> A=[$w, $a, $l, $t, $e, $r], B=[$C, $a, $z, $z, $o, $l, $a].
"Cazzola"
8> A++ " " ++B.
"Walter Cazzola"
9> A--B.
"Wter"
```

- used to store a variable number of items;
- lists are dynamically sized.

Sequential Erlang Overview

Assignments & Pattern Matching

functions

guards

comprehensions

References

```
1> A = 1.  
1  
2> A = 2.  
** exception error: no match of right hand side value 2
```

- are just name bindings to values and **cannot** be modified;
- start with an uppercase letter and `_` is an anonymous variable.
- the bindings are created via pattern matching.

```
3> [B|L]=[a,b,c].  
[a, b, c]  
4> {A,B,L}.  
{1, a, [b, c]}  
5> {X, X} = {B, B}.  
{a, a}  
6> {Y, Y} = {X, b}.  
** exception error: no match of right hand side value {a, b}  
7> 1=A.  
1  
8> 1=Z.  
* 1: variable 'Z' is unbound  
9> {A1, _, [B1|_], {B1}} = {abc, 23, [22,x], {22}}.  
{abc, 23, [22, x], {22}}  
10> A1.  
abc  
11> B1.  
22
```

Sequential Erlang Overview

Functions & Modules

Starting with
Erlang

Walter Cazzola

Erlang

characteristics

Sequential
Erlang

BEAM
datatypes
pattern matching
functions
guards
comprehensions

References

```
name(pattern1, pattern2, ..., pattern1n) [when guard1] -> body1 ;  
name(pattern21, pattern22, ..., pattern2n) [when guard2] -> body2 ;  
...  
name(patternk1, patternk2, ..., patternkn) [when guardk] -> bodyk .
```

- clauses are scanned sequentially until a match is found;
- when a match is found all the variables in the head become bound;

```
-module(ex_module).  
-export([double/1]).
```

```
double(X) -> times(X, 2).  
times(X, N) -> X * N.
```

- double can be called from outside the module, times is local to the module;
- double/1 means the function double with one argument (note that double/1 and double/2 are two different functions).

References

Each clause in function definition can be guarded by a **guard sequence**.

- a guard is a sequence G_1, G_2, \dots, G_n of guard expressions;
- a guard expression is a subset of Erlang expressions to guarantee to be free of side-effects;
- a guard sequence is true when all the guard expressions evaluate to true

Valid guard expression are:

- the atom true and other constants;
- calls to some built-in functions (BIFs);
- arithmetic and Boolean expressions; and
- short-circuit expressions (**andalso**/**orelse**).

Permitted BIFs are:

is_atom/1
is_function/1
is_port/1
abs/1
hd/1
self/1

is_binary/1
is_integer/1
is_record/2
bit_size/1
length/1
size/1

is_bitstring/1
is_list/1
is_record/3
byte_size/1
node/0
tl/1

is_float/1
is_number/1
is_reference/1
element/2
node/1
trunc/1

is_function/2
is_pid/1
is_tuple/1
float/1
round/1
tuple_size/1

`[X || Qualifier1, ..., Qualifiern]`

X is an expression, each qualifier is a generator or a filter

- Generators are in the form `Pattern <- ListExpr` where `ListExpr` evaluates to a list;
- filters are either predicates or Boolean expressions.

```
-module(sort).  
-export([qsort/2]).  
  
qsort(_, []) -> [];  
qsort(P, [Pivot|TL]) ->  
    qsort(P, [X || X <- TL, P(X,Pivot)]) ++ [Pivot] ++ qsort(P, [X || X > Pivot, P(X,Pivot)]).
```

```
-module(prime).  
-export([primes/1]).  
  
primes(N) when N > 1 -> [X || X <- lists:seq(2,N),  
    (length([Y || Y <- lists:seq(2, trunc(math:sqrt(X))), (X rem Y) == 0]) == 0)];  
primes(_) -> [].
```

```
1> sort:qsort(fun(X, Y) -> X < Y end, [13, 1, -1, 8, 9, 0, 3.14]).  
[-1, 0, 1, 3.14, 8, 9, 13]  
2> sort:qsort(fun(X, Y) -> X > Y end, [13, 1, -1, 8, 9, 0, 3.14]).  
[13, 9, 8, 3.14, 1, 0, -1]  
3> prime:primes(100).  
[2,3,5,7,11,13,17,19,23,29,31,37,41,43,47,53,59,61,67,71,73,79,83,89,97]
```
